The Effects of Family Structure and Family Processes on Externalizing and Internalizing Behaviors of Male and Female Youth: A Longitudinal Examination
Kristin Y. Mack, Jennifer H. Peck, and Michael J. Leiber

ExaminingChildMortality

Mikaela Mosher North Carolina State University

In this article we evaluate the effects of maternal age on the frequency of infant deaths in the United States, using the third wave of the National Longitudinal Study of Adolescent Health (Add Health), a nationally representative sample of young adults. We argue that the risk factors in the family exert a stronger and more consistent effect on infant mortality than do the effects of other demographic characteristics.

Sociologists and criminologists have been interested in understanding these rates because of the potential implications for the development of effective interventions. A number of studies have shown that there is a consistent association between young motherhood and children's school failure, Deviant Behavior, 36:511–526, 2015.
